TOZER

The taste of innovation

INTRODUCTION

Tozer

The taste of innovation

Tozer is a successful, independent vegetable plant breeding company. We've been committed to developing and supplying new varieties of vegetables to our customers for nearly 80 years. We are an international company head quartered in the UK with offices and warehouses in the USA, Holland and Spain. We currently export our seed to over 60 countries worldwide.

In this catalogue you will see the latest selection of Tozer bred varieties including our versatile and successful range of hybrid celeries and parsnips. We were the first breeding company to produce commercial F1 hybrids of these products and are now considered world leaders in them.

Also of note are our new range of F1 leeks, our award winning Kalettes® and our latest F1 kale and cavalo nero varieties. We feel that these really represent 'The Taste of Innovation'.

Tozer is a family owned company committed to responding quickly to the changing requirements of the specialised markets we work in. We welcome the chance to understand the challenges our customers face and we maintain close contact with our distribution network in order to react to changes in production and consumption of vegetables. Please do get in touch if you feel our varieties may help your business to prosper.

PRODUCT FORMS

Natural Seed	Clean seed without impurities. Complies with international standards.
Precision Seed	Seed which has been calibrated and therefore has a uniform measurement.
Primed Seed	Priming is the activation of the germination process to ensure a faster and more uniform emergence after sowing.
Coated Seed	The seed is completely coated, usually by a pigmented layer around the seed. The original seed shape remains intact. Additional ingredients and treatments, identifiable by a colour code, may be added. A coated seed can also be primed.
Pelleted Seed	Pelleting is defined as a process of changing the shape by the application of filler materials to homogenise the size and shape of the seed and thus facilitate sowing. A pelleted seed can also be treated and primed.
